

ABSTRACT OF THE DISCLOSURE:

A mobile terminal of the invention includes a language translation unit and stores in advance a language used in the mobile terminal. When the mobile terminal calls or receives a call, the mobile terminal recognizes a country ID corresponding to a people who is called by the mobile terminal or who calls the mobile terminal, by using a telephone number, notification information of a base station, or a control signal from the mobile terminal. Then, the mobile terminal performs language translation by using a translation pattern determined based on the language used in the mobile terminal and the country ID.
